13 Known issue **25**

Introduction

Welcome to the UUU (Universal Update Utility). This is an evolution of MFGTools (aka MFGTools v3).

UUU is Freescale/NXP i.MX Chip image deploy tools.

With the time, the need for an update utility portable to Linux and Windows increased. UUU have the same usage on both Windows and Linux. It means the same script works on both OS.

UUU is **command line tools**. look like

```
uuu (universal update utility) for nxp imx chips -- libuuu-1.0.1-gffd9837
```

```
Succues:0          Failure:3          Wait for Known USB Device Appear...
```

```
1:11      5/5 [          ] SDP: jump -f u-boot-dtb.imx - ↔  
      ivtinitramf....
```

```
2:1      1/5 [====>  ] SDP: boot -f u-boot-imx7dsabresd_sd. ↔  
      imx ....
```

UUU design as common library and UI. So user can easily integrate into their tools with uuu library. UUU also easy run in any scripts.

[PDF](#) of wiki content also is available at release page.

Running environment

- Windows 10, 64bit, early version(below 1.2.0) need install [vs2017 redistribute package](#)
- Ubuntu 16.14 or above, 64bit

Windows 7 user please read [WIN7-User-Guide](#)

Typical Usage

Set board boot pin to serial download mode. Generally iMX ROM will fail back to usb serial download mode if boot failure.

Download uboot

```
uuu bootloader
```

Burn uboot into emmc

```
uuu -b emmc bootloader
```

Burn bootimage into QSPI flash

```
uuu -b qspi qspi_bootloader
```

Burn rootfs image into emmc

```
uuu -b emmc_all bootloader rootfs.sdcard
```

Decompress rootfs image and burn into emmc (since 1.1.87)

```
uuu -b emmc_all bootloader rootfs.sdcard.bz2/*
```

Notes: bootloader means bootable image, which included ROM required header. for imx6/7, it should be uboot.imx generally. for imx8qxp\imx8qm\imx8mm\im8mq, it is flash.bin.

Burn release image into emmc

```
uuu L4.9.123_2.3.0_8mm-ga.zip
```

Note: some release combine multi board into one zip package, you need use `uuu release.zip/uuu.auto-<boardname>`

More usage please refer [Example](#)

Typical Script

uuu's script is plain text file

****first line must be**

```
uuu_version 1.0.1
```

version number represent the minimum uuu version that uuu can parse this script.

Then flow uuu commands.

UUU command format as

PROTOCOL: CMD

The below is example to boot uboot for imx6 and imx7.

```
uuu_version 1.0.1
SDP: dcd -f u-boot.imx
SDP: write -f u-boot.imx -ivt 0
SDP: jump -f u-boot.imx -ivt 0
```

more sample scripts see [Sample-script](#)

The below table environment may be used when write uuu script

Table 1: Table Fastboot environment

| Variable | Description |
|-----------------|---|
| fastboot_dev | fastboot flash device, support mmc and sata |
| fastboot_buffer | fastboot download buffer address |
| fastboot_bytes | fastboot download file size |
| emmc_dev | eMMC device number |
| sd_dev | sd slot device number |

License

uuu is licensed under the BSD license. See LICENSE. The BSD licensed prebuilt Windows binary version of uuu is statically linked with the LGPL libusb library, which remains LGPL.

- bzip2 (BSD license) is from <https://github.com/enthought/bzip2-1.0.6>
- zlib (zlib license) is from <https://github.com/madler/zlib.git>
- libusb (LGPL-2.1) is from <https://github.com/libusb/libusb.git>

What Firmware Need

| What you want | Firmware Need |
|---|--|
| Download bootloader | N/A |
| Burn Image to eMMC/SD | uboot with fastboot enable |
| Burn Image to qspi/spi/nor | uboot with fastboot enable |
| Burn Image into Nand flash | uboot(1), linux kernel\initramfs\uboot\dtb |
| Need linux shell cmd such as fdisk | uboot(1), linux kernel\initramfs\uboot\dtb |
| Boot linux kernel with rootfs already in eMMC | uboot with fastboot enable |
| Boot Linux kernel with nfs over USB | uboot with fastboot enable, initramfs |

(1) prefer enable fastboot. If ROM HID support write additional image to DDR place, you can write kernel\dtb\initramfs to ddr before jump to uboot. Enable fastboot give more flexibility to change kernel command line.

Setup auto parameter complete

windows

Just power shell support customized auto complete

Powershell: Enjoy auto [tab] command complete by run below command or put into Documents\WindowsPowerShell\Microsoft.PowerS

```
Register-ArgumentCompleter -CommandName uuu -ScriptBlock {param($commandName, ←
    $parameterName, $wordToComplete, $commandAst, $fakeBoundParameter); C:\Users\ ←
    nxa23210\uuu\uuu\x64\Release\lib\uuu.exe -autocomplete $parameterName }
```

linux

Enjoy auto [tab] command complete by put below script into /etc/bash_completion.d/uuu

```
_uuu_autocomplete()
{
    COMPREPLY=( $(/home/lizhi/source/mfgtools/uuu/uuu $1 $2 $3) )
}
complete -o nospace -F _uuu_autocomplete uuu
```

L4.9.123_2.3.0_8MM GA

It is first official BSP release to support uuu For L4.9.123_2.3.0_8MM GA with i.MX8M Mini, see [?]

Syntactic

uuu (Universal Update Utility) for nxp imx chips -- libuuu_1.3.191-1-g7010e4e

```
uuu [-d -m -v -V] <bootloader|cmdlists|cmd>
```

```
bootloader  download bootloader to board by usb
cmdlist     run all commands in cmdlist file
             If it is path, search uuu.auto in dir
             If it is zip, search uuu.auto in zip
cmd         Run one command, use -H see detail
```

```

example: SDPS: boot -f flash.bin
-d          Daemon mode, wait for forever.
-v -V      verbose mode, -V enable libusb error\warning info
-dry       Dry run mode, check if script or cmd correct
-m         USBPATH Only monitor these paths.
           -m 1:2 -m 1:3

-t         Timeout second for wait known usb device appeared
-pp        usb polling period in milliseconds
uuu -s     Enter shell mode. uuu.inputlog record all input commands
           you can use "uuu uuu.inputlog" next time to run all commands

uuu -udev  linux: show udev rule to avoid sudo each time
uuu -lsusb List connected know devices
uuu -h -H  show help, -H means detail helps

uuu [-d -m -v] -b[run] <emmc|emmc_all|fat_write|nand|qspi|sd|sd_all|spl> arg...
Run Built-in scripts
emmc      burn boot loader to eMMC boot partition
           arg0: _flash.bin  bootloader
           arg1: _image[Optional]  image burn to emmc, default is the same as ↵
           bootloader
emmc_all  burn whole image to eMMC
           arg0: _flash.bin
           arg1: _rootfs.sdcard
fat_write update one file in fat partition, require uboot fastboot ↵
           running in board
           arg0: _image  image, which cp to fat partition
           arg1: _device  storage device, mmc\sata
           arg2: _filename[Optional]  file name in target fat partition, only ↵
           support rootdir now
           arg3: _partition
nand      burn boot loader to NAND flash
           arg0: _flash.bin  bootloader
           arg1: _image[Optional]  image burn to nand, default is the same as ↵
           bootloader
qspi     burn boot loader to qspi nor flash
           arg0: _flexspi.bin  bootloader
           arg1: _image[Optional]  image burn to flexspi, default is the same ↵
           as bootloader
sd        burn boot loader to sd card
           arg0: _flash.bin  bootloader
           arg1: _image[Optional]  image burn to emmc, default is the same as ↵
           bootloader
sd_all   burn whole image to sd card
           arg0: _flash.bin
           arg1: _rootfs.sdcard
spl      boot spl and uboot
           arg0: _flash.bin

uuu -bshow <emmc|emmc_all|fat_write|nand|qspi|sd|sd_all|spl>
           Show built-in script

```

Notes: Some board supports super speed (USB3.0). USB 3.0 port path is difference USB 2.0. If use -m to filter port, you need add USB 3.0 port number otherwise fastboot will not be detected.

Usage Example

Basic

Download boot loader for imx6\imx7

```
uuu uboot.imx
```

Download boot loader for imx8qxp

```
uuu flash.bin
```

Download SPL and uboot, such as imx8mq.

```
uuu sdp: boot -f flash.bin
uuu sdp: delay 1000
uuu sdp: write -f flash.bin -offset 0x57c00
uuu sdp: jump
```

Burn Android Image to eMMC

```
uuu android.zip (not implement default yet)
```

Burn yocto Image to eMMC

```
uuu L4.9.123_2.3.0_8mm-ga.zip
```

Built-in script

| | |
|---|-------------------------------|
| uuu -b emmc bootloader | Write bootloader to emmc |
| uuu -b emmc_all bootloader rootfs.sdcard | Write rootfs to emmc |
| uuu -b emmc_all bootloader rootfs.sdcard.bz2/* rootfs to emmc | Decompress rootfs and write ↔ |
| uuu -b sd bootloader | Write bootloader to sd card |
| uuu -b sd_all bootloader rootfs.sdcard | Write rootfs to sd card |
| uuu -b sd_all bootloader rootfs.sdcard.bz2/* rootfs to sd card | Decompress rootfs and write ↔ |
| uuu -b qspi qspi_bootloader | write bootloader to qspi |
| uuu -b qspi qspi_bootloader m4image | write m4image to qspi |
| uuu -b spl bootloader | Download SPL and uboot |

Notes:

Some boards have many sd slot. built-in script only work uboot environment `#{ sd_dev}` point to slot

Some boards have not emmc chip, emmc build in script does not work for such boards

multi boards support

For the same boards

```
uuu -d uuu.auto                                The same boards connected
```

For the difference boards

```
uuu -d -m 1:1 -m 2:1 boardA_uuu.auto          monitor port 1:1 and 2:1 for ↔  
boardsA.  
uuu -d -m 1:3 -m 4:1 boardB_uuu.auto          monitor port 1:3 and 4:1 for ↔  
boardsB.
```

Note: please avoid monitor the same port by difference uuu instance, which cause unexpected result.

Talk with fastboot

boot linux kernel

```
uuu FB: ucmd setenv fastboot_buffer ${loadaddr}  
uuu FB: download -f Image  
uuu FB: ucmd setenv fastboot_buffer ${fdt_addr}  
uuu FB: download -f imx8qxp_mek.dtb  
uuu FB: acmd booti ${loadaddr} - ${fdt_addr}
```

Extended environment for fastboot

```
fastboot_buffer      Image download address  
fastboot_bytes       reflect previous download image byte size
```

write image to emmc

```
uuu FB: flash -raw2sparse all <image file>
```

Talk with linux kernel, transfer file between board and pc

```
on board, run \linuxrc&  
on pc,      uuu fbk:ucp file t:\file
```

Sample scripts

Supported protocol

UUU is scripted base multi protocol system.

Built in config:

| Pctl | Chip | Vid | Pid | BcdVersion |
|-------|----------|--------|--------|------------------|
| SDPS: | MX8QXP | 0x1fc9 | 0x012f | [0x0002..0xffff] |
| SDPS: | MX8QM | 0x1fc9 | 0x0129 | [0x0002..0xffff] |
| SDP: | MX7D | 0x15a2 | 0x0076 | |
| SDP: | MX6Q | 0x15a2 | 0x0054 | |
| SDP: | MX6D | 0x15a2 | 0x0061 | |
| SDP: | MX6SL | 0x15a2 | 0x0063 | |
| SDP: | MX6SX | 0x15a2 | 0x0071 | |
| SDP: | MX6UL | 0x15a2 | 0x007d | |
| SDP: | MX6ULL | 0x15a2 | 0x0080 | |
| SDP: | MX6SLL | 0x1fc9 | 0x0128 | |
| SDP: | MX7ULP | 0x1fc9 | 0x0126 | |
| SDP: | MXRT106X | 0x1fc9 | 0x0135 | |
| SDP: | MX8MM | 0x1fc9 | 0x0134 | |
| SDP: | MX8MQ | 0x1fc9 | 0x012b | |
| SDPU: | SPL | 0x0525 | 0xb4a4 | [0x0000..0x04ff] |
| SDPV: | SPL1 | 0x0525 | 0xb4a4 | [0x0500..0xffff] |
| FBK: | | 0x066f | 0x9afe | |
| FBK: | | 0x066f | 0x9bff | |
| FB: | | 0x0525 | 0xa4a5 | |
| FB: | | 0x18d1 | 0x0d02 | |

Table 2: Table UUU Protocol to USB lower level Map

| UUU Protocol | USB Low level transfer |
|--------------|--|
| SDP | HID i.MX6/7, i.MX8 MM, i.MX8M |
| SDPU\SDPV | HID uboot implement of SDP, SPL download uboot |
| SDPS | HID i.MX8QXP i.MX8QM |
| FB | winusb (windows), raw transfer by libusb |
| FBK | winusb (windows), raw transfer by libusb |

SDP: i.MX6/7 ROM download protocol

Supported command:

Run DCD from image with ivt header

```
dcd -f <filename>
```

write image to address.

```
write -f <filename> [-addr 0x000000] [-ivt 0]
```

ivt 0 means write to the address, which ivt pointer

jump to image with ivt header

```
jump -f <filename> [-ivt 0]
```

boot image, include (dcd, write and jump three commands)

```
boot -f <filename> [-nojump]
```

HABv4 closed chip support

For boot images not including a DCD table the same image used for SDCard/eMMC boot can be used with UUU tool.

For boot images including a DCD table, the DCD is loaded in OCRAM and must be properly signed.

Since U-Boot v2017.01 a build log containing the U-Boot and DCD addresses and lengths is available just after building U-Boot:

```
$ cat u-boot-dtb.imx.log
Image Type: Freescale IMX Boot Image
Image Ver: 2 (i.MX53/6/7 compatible)
Mode: DCD
Data Size: 602112 Bytes = 588.00 KiB = 0.57 MiB
Load Address: 877ff420
Entry Point: 87800000
HAB Blocks: 877ff400 00000000 0008ec00
DCD Blocks: 00910000 0000002c 000001c4
```

Users can copy the information above to create their CSF Authenticate Data command:

```
Block = 0x877ff400 0x00000000 0x0006DC00 "u-boot-dtb.imx", \
        0x00910000 0x0000002c 0x000001c4 "u-boot-dtb.imx"
```

Alternatively users can also extract the DCD length from the DCD table header:

```
$ od -x -j 0x2c -N 4 --endian=big u-boot-dtb.imx
0000054 d201 c440
0000060
DCD Header: 0xd2, DCD Length: 0x01c4, DCD Version: 0x40
```

For the i.MX devices not supporting the skip DCD command (i.MX6Dual/Quad and i.MX6Sololite) the pointer to the DCD table is cleared in the IVT in order to prevent the HAB library from processing the DCD table again during the authentication process. There is no need to re-initialize memory when it already contains valid data.

Since the IVT is modified when downloading to the target the binary must be signed with a cleared DCD pointer. However, the binary must be provided with a valid DCD pointer to allow the UUU tool to locate the DCD table.

The following script can be used to handle the DCD pointer:

```
#!/bin/bash
# DCD address must be cleared for signature, as UUU will clear it.
if [ "$1" == "clear_dcd_addr" ]; then
    # store the DCD address
    dd if=$2 of=dcd_addr.bin bs=1 count=4 skip=12
    # generate a NULL address for the DCD
    dd if=/dev/zero of=zero.bin bs=1 count=4
    # replace the DCD address with the NULL address
    dd if=zero.bin of=$2 seek=12 bs=1 conv=notrunc
fi
# DCD address must be set for mfgtool to localize the DCD table.
if [ "$1" == "set_dcd_addr" ]; then
    # restore the DCD address with the original address dd
    if=dcd_addr.bin of=$2 seek=12 bs=1 conv=notrunc
    rm zero.bin
fi
```

The steps below can be used as an example:

```
$ ./mod_4_mfgtool.sh clear_dcd_addr u-boot-dtb.imx
$ ./cst --i u-boot-csf.txt --o u-boot-csf.bin
$ ./mod_4_mfgtool.sh set_dcd_addr u-boot-dtb.imx
```

SDPU\SDPV: uboot implement simplified ROM SDP protocol

Uboot implemented i.MX 6/7 ROM SDP protocol. The support command the same as SDP.

SDPV is upgrade version of SDPU, which support `-skipspl` option for write command

See below for uboot requirement [uboot-config-requirement](#)

SDPS: i.MX8QXP and i.MX8QM ROM download protocol

send image by `sdp` command.

```
boot -f <filename> [-offset 0x0000]
```

FB: Android fastboot protocol

refer [fast boot protocol](#)

See below for [uboot requirement](#)

Support command:

```
getvar
ucmd <any uboot command>
acmd <any never returned uboot command, like booti, reboot>
```

```
# partition "all" means whole device.
flash [-raw2sparse] <partition> <filename>
download -f <filename>
```

****Some Uboot command need long time to finish. Default FB timeout is 2s. You can use below method to change timeout value**

```
# time out set to 10000ms
FB[-t 10000]: ucmd <any uboot command>
```

Table 3: Table Fastboot environment

| Variable | Description |
|------------------------------|---|
| <code>fastboot_dev</code> | fastboot flash device, support mmc and sata |
| <code>fastboot_buffer</code> | fastboot download buffer address |
| <code>fastboot_bytes</code> | fastboot download file size |
| <code>emmc_dev</code> | eMMC device number |
| <code>sd_dev</code> | sd slot device number |

FBK: Android fastboot protocol, implement at initramfs. See project [imx-uuc](#)

Support command:

```
ucmd <any kernel command> and wait for command finish
acmd <any kernel command> don't wait for command finish
sync wait for acmlid processs finish.
ucp <source> <destinate> copy file from/to target
```

```
T:<filename> means target board file.
T:- means copy data to target's stdio pipe.
copy image T:/root/image ;download image to path /root/ ←
image
copy T:/root/image image ;upload /root/image to file ←
image.....
```

Example for transfer big file

```
acmd tar - ; run tar background and get data from stdio
ucp rootfs.tar.gz T:- ; send to target stdio pipe
sync ; wait for tar process exit.
```

Linux environment:

Each command in separate process so environment can not be affect next command. Use below method to workaround this problem.

```
FBK: ucmd source /tmp/mtd.sh; flash_erase /dev/mtd${nandrootfs} 0 0
```

Common command for all protocol

Table 4: Table Common command for all protocol

| Command | Description |
|----------|---|
| Done | last command for finish whole flow. |
| Delay | Busy wait for millisecond |
| SH/SHELL | run external command |
| < | stdout as command, such as "< echo ucmd print", which generally used for burn serial number |

Migration from mfgtool ucl2.xml

**Most case user can use uboot fastboot protocol to finish image program work.

In case you have to load kernel to burn whole image.

The below simple map ucl2.xml to uuu script.

| ucl2.xml | uuu |
|--|---|
| <CMD state="BootStrap" type="boot" body="BootStrap" file ="firmware/flash.bin" ifdev="MX8QXPB0">Loading boot image</CMD> | SDPS: boot -f flash.bin |

Win 7 User Guide

Win7 user may face some additional one time setup work because original win7 missed a updated .inf file

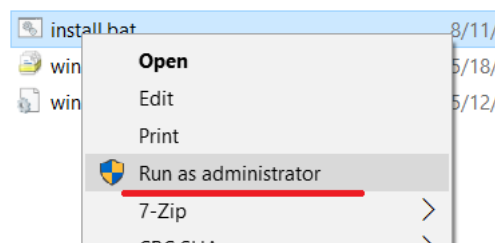

Back Ground

Win7 ships with correct *winusb.sys* file. but is missing an updated *.inf* that associates with "usb\ms_comp_winusb" devices. Normally if the USB device supports Microsoft OS descriptors, then it will allow Windows to automatically install the WinUSB driver. This mechanism is supported "in-box" for Win8 and newer. For Win7 the mechanism is supported through Windows update. Depending on the update policy for the Win7 machine, the appropriate driver may or may not be already available on the machine. If it is not already on the machine, user can use the following manual procedure to install the driver if necessary. (copy from https://www.silabs.com/community/interface/knowledge-base.entry.html/2017/02/06/manually_installwin-A2Jj)

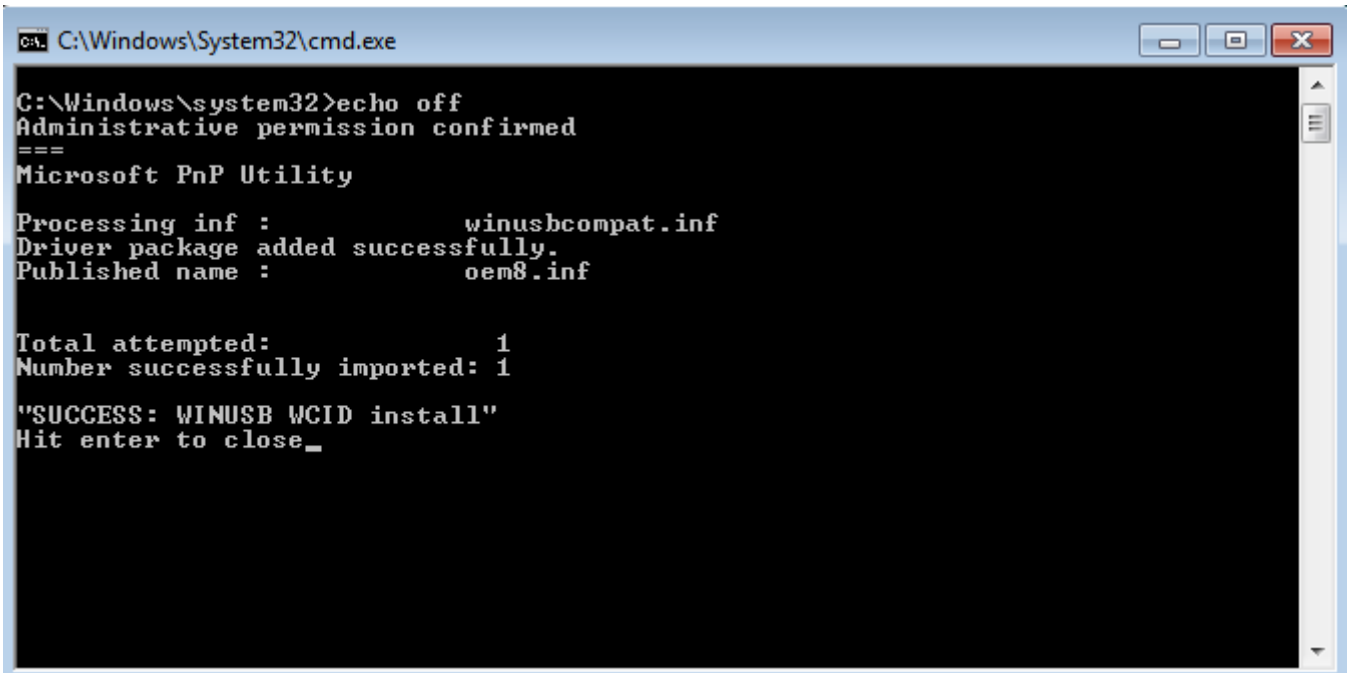

Some windows update also included updated .inf file. You can try run uuu to see what happen. If windows report "can't install driver", that means your system missed such update file.

Install updated winusb inf file

- [Download package](#)
- unzip
- run install.bat as administrator permission.

- The below screen show install success

Notes:

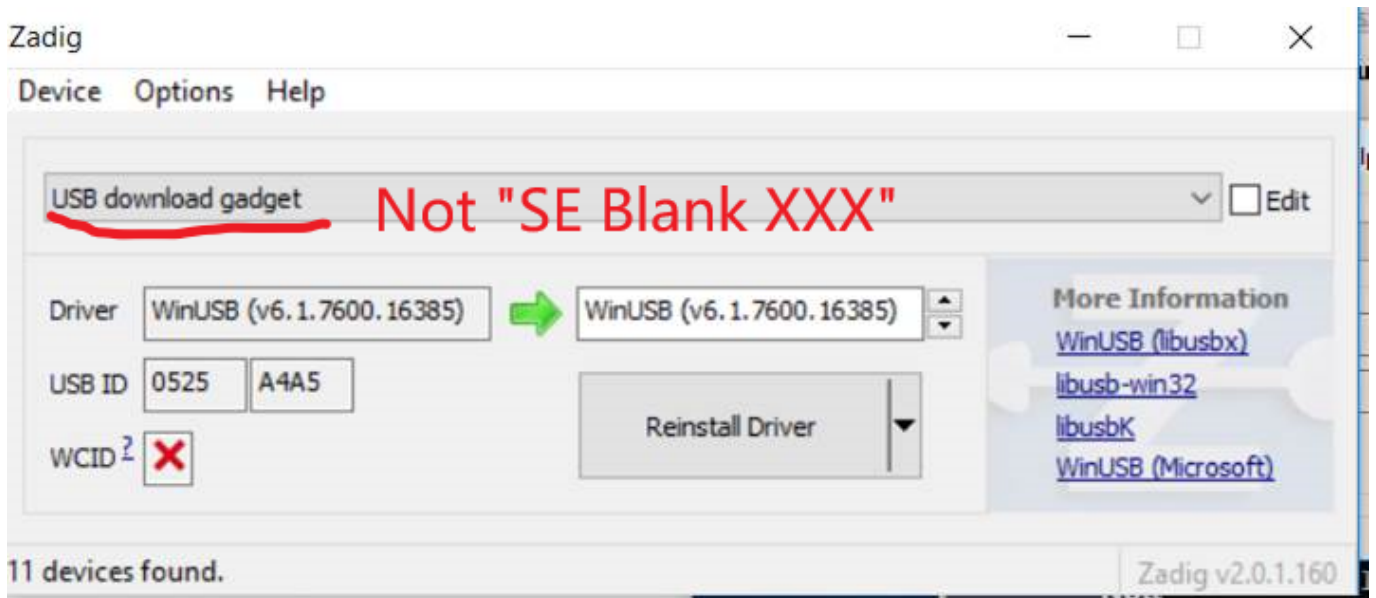

4.9.123 8MM GA and 4.14 beta release missed a patch. Please apply below [patch](#) in uboot

Use zadig to install winusb driver

Please make sure you success download uboot and uboot auto launch fastboot command. windows find **USB download device**, NOT SE Blank

If still fail install winusb driver you can try below method. you can try download zadig from <https://zadig.akeo.ie/>

Choose **USB download device** and click install.

If you already apply patch and still see WCID is red "x", please submit issue.

Notes:

"SE Blank xx" is ROM HID device. PLEASE DON'T CHOOSE IT TO WINUSB. libusb can work well with HID device. Only "Usb download device" need check

FAQ

- **Win7 can't found driver**

- Need install winusb driver, you can use <https://zadig.akeo.ie/> to install winusb driver
- see page [WIN7-User-Guide](#)

- **Linux: Open device failure**

```
sudo uuu xxx
```

- **Some iMX8mm(845) chip failure write at linux system**

Need apply ROM patch, contact FAE to get it.

- **How to use absolute path in scripts**

Default all paths in script is related uuu scripts. if you want to use absolute path in scripts ↔

Add ">" in path like

```
>/home/xxx
```

- **uuu exit silence or report missed dll**

Please upgrade to 1.2.x

- **How to avoid sudo in linux**

Put below context into /etc/udev/rules.d/99-uuu.rules (need sudo)

```
SUBSYSTEM=="usb", ATTRS{idVendor}=="1fc9", ATTRS{idProduct}=="012f", MODE="0666"
SUBSYSTEM=="usb", ATTRS{idVendor}=="1fc9", ATTRS{idProduct}=="0129", MODE="0666"

- **out of memory at 64bit system**

If use bz2 or zip file, it is possible out of memory. Please increase swap partition size in linux. increase virtual memory size in windows.

- **How to use uuu in docker**

libusb need udev event to get new devices appeared.

Added option

```
docker run --net=host -v /run/udev/control:/run/udev/control
```

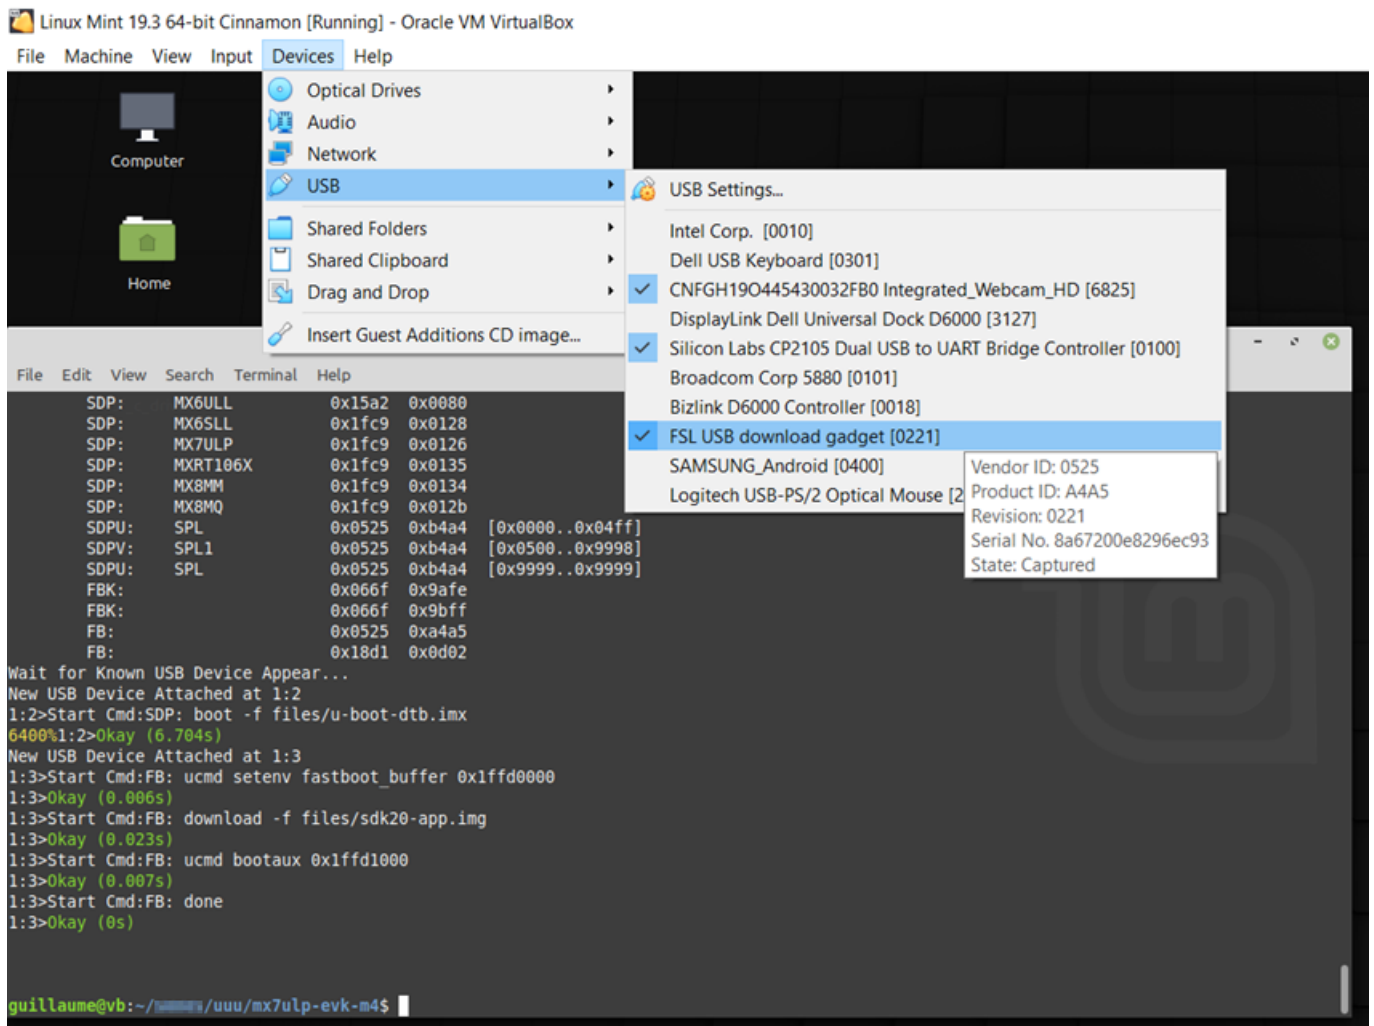

<https://stackoverflow.com/questions/49687378/how-to-get-hosts-udev-events-from-a-docker-container>

- **How to use uuu in virtual machine**

- Map HID device into virtual machine

- Map fastboot device into virtual machine after uboot boot

- You can use uuu burn image in virtual machine

Build Steps

windows

- download visual studio 2017 community version (free)
- git clone <https://github.com/NXPmicro/mfgtools.git>
- cd mfgtools
- git submodule init
- git submodule update
- open msvs/uuu.sln by vs2017
- click build

linux

- git clone <https://github.com/NXPmicro/mfgtools.git>
- cd mfgtools
- sudo apt-get install libusb-1.0.0-dev libzip-dev libbz2-dev
- cmake .
- make

Uboot config requirement

To talk with uuu, uboot need enable fastboot. fastboot need auto run when detect boot from USB.

```
CONFIG_CMD_FASTBOOT=y
CONFIG_USB_FUNCTION_FASTBOOT=y
CONFIG_USB_GADGET=y
CONFIG_USB_GADGET_DOWNLOAD=y
CONFIG_USB_GADGET_MANUFACTURER="FSL"
CONFIG_USB_GADGET_VENDOR_NUM=0x0525
CONFIG_USB_GADGET_PRODUCT_NUM=0xa4a5
CONFIG_CI_UDC=y # UDC need change according system, ↔
    some system use CONFIG_USB_DWC3, some use CONFIG_USB_CDNS3
CONFIG_FSL_FASTBOOT=y
CONFIG_FASTBOOT=y
CONFIG_FASTBOOT_BUF_ADDR=0x83800000 # Address need change according ↔
    system, generally it can be the same as ${LOADADDR}
CONFIG_FASTBOOT_BUF_SIZE=0x40000000
CONFIG_FASTBOOT_FLASH=y
CONFIG_FASTBOOT_FLASH_MMC_DEV=1
CONFIG_EFI_PARTITION=y
CONFIG_ANDROID_BOOT_IMAGE=y
```

If use SPL, SDP need be enabled.

```
CONFIG_SPL_USB_HOST_SUPPORT=y
CONFIG_SPL_USB_GADGET_SUPPORT=y
CONFIG_SPL_USB_SDP_SUPPORT=y
CONFIG_SDP_LOADADDR=0x40400000 # Address need change according ↔
    system, choose free memory
```

uuu related patches.

https://source.codeaurora.org/external/imx/uboot-imx/log/?h=imx_v2017.03_4.9.123_imx8mm_ga

About Fastboot enable:

```
719651a MLK-18257-1 Enable fastboot support in qxp mek board
d5226a3 MLK-18257-2: fix fastboot build warning
219c989 MLK-18257-3 run fastboot if initramfs is in validate
09b1876 MLK-18257-4 use another method check if need run bootcmd_mfg
3b1fa9d MLK-18257-5 enhance fastboot uboot cmd
ca96e0b MLK-18406 fastboot support all partition
```

About uboot SDP enable:

```

192a26d MLK-18707-1: SDP: use CONFIG_SDP_LOADADDR as default load address
9764fb2 MLK-18707-2 iMX8M enable fastboot as default
db9a634 MLK-18862 imx8mm uuu can write emmc by fastboot

```

Additional environment need be define

Table 5: Table uuu environment

| Variable | Usage | Description |
|------------|--------------------------|--|
| emmc_dev | emmc burn | eMMC device number |
| sd_dev | burn sd | sd slot device number |
| kboot | boot kernel\burn nand | kernel boot command, it is booti for arm64, bootz for arm32 |
| weim_uboot | burn weim nor | uboot burn to position of weim nor |
| weim_base | burn weim nor | weim base address |
| mtdparts | burn nand | NAND flash partition configuration, such as "mtdparts=8000000.nor:1m(boot),-(rootfs)\;gpmi-nand:64m(nandboot),16m(nandkernel),16m(nandrootfs)" |
| spi_bus | burn spi (not qspi\fspi) | spi nor flash bus number |
| spi_uboot | burn spi (not qspi\fspi) | spi nor flash uboot offset |

kernel config requirement

Some kernel config required

- USB CONFIG FS need be built-in
- One of UDC driver and PHY need be built-in
- Function FS need be enabled

```

Device Drivers
  USB support
    USB gadget support (very last entry)
      USB Gadget Drivers (...)
        USB functions configurable through configfs
          Mass storage
          Function filesystem (functionFS)

```

Release Notes

1.4.138

New features

- Add help option -IgSerNum to set windows registry to ignore serial number above too much entry in register when burn many boards.

- Add snap support
- Add 8ulp support
- Deploy mac image

Bug fixes

- return out of memory when allocate failure
- -bshow don't show uuu version information and recover cursor ESC

1.4.72**New features**

- http/https add port support at url
- improve progress show when burn android sparse image

Bug fixes

- Fix the dead loop when flash specific android super.img. There are bug when split big super.img into small sparse file running time. The bug trigger if split point at whole sparse chunk.

1.4.43**New features**

- add environment variable support command
- Added support for *FB:reboot* and *FASTBOOT:reboot*
- allow to pass sparse limit from command line
- Update version number support build number > 255
- Mac OS (Catalina) support

Bug fixes

- fix #193 fb:< echo ucmd print failure
- fix fat_write partition parser error

1.3.191**New features**

- Added Boundary Devices fastboot IDs
-

Bug fixes

- Workaround problem: some data pattern cause timeout at dell docker hub.
- update 7D free memory address, errata e11166 https://www.nxp.com/docs/en/errata/IMX7DS_3N09P.pdf
- Fix can't build from source tarball.

1.3.154**New features**

- ffu image basic support
- add boundary device VID/PID
- Added basic fastboot logical partition support

Bug fixes

- fastboot: fix oem command separator
- Fix crash when download bz2 file

1.3.134**Bug fixes**

- fix qm\qxp download failure if use spl image

1.3.130**New features**

- Add android fastboot continue command
- Add i.MX8DXL support
- Add i.MX865 support
- build in script sd, support burn difference uboot
- Add option -pp to set pool time
- sdp: bootcmd: add support for --dcdaddr
- change the default nandbeb command from update to init

Bug fixes

- fix one line miss when exit uuu
 - fix show 99% when use bz2 file
 - fix miss ucmd at nand built-in script
 - fix show time wrong, use system time instead of tick as timesample
-

1.3.102

New features

- Support simple https. (experimental).
- -b option support script file
- support ≥ 4 G zip file

Bug fixes

- fixed #136 fix decompress failure if use uncompressed method in zip file.
- fixed something wait forever when download bz2 from http
- fix http request failure at some host (use $\backslash\r\n$ at http request)

1.3.82

New features

- add dry-run option to check if all files exist at script
- Start download before scan whole Bz2 file. Progress only show how many data burned instead of percentage before finish scan.
- Add NAND built in script to burn boot loader into nand flash, which need uboot support nandbcb command
- Add --skipfhdr option to skip flexspi header
- Can use SD card uboot for flexspi, which need uboot support qspihdr command
- Add timestamp info for each command. (-v show how many time is consumed for each command).
- Add tar.bz2 support.(experimental).
- Add tar.gz support. (experimental).
- Add http download. (experimental).
- Auto append /* for bz2 file when use built-in script.
- Add -lsusb option to list all connected known devices to help find usb path when do multi boards support

Bug fixes

- Fix SPL download uboot failure if uboot size > 2 M
 - Upgrade libusb to 1.0.23-rc3 to resolve some windows compatibility problem. such as exit if not usb port under virtual root hub.
 - Fix bz2 decompress problem if bz2 created by bzip2 instead of pbzip2.
 - Fix missed last chunk data for android sparse image
 - fixed #123: implement timeout for wait known usb device appear
-

1.2.135

New features

- Support i.MX28
- Add Read\write a memory address for i.MX6/i.MX7
- built-in script emmc support burn difference files
- Support i.MX815

Bug fixes

- fix crash when console width between 47 to 54
- fix crash when use ssh <host> uuu
- fix wrong data by decompress sdcard.bz2/* if enable -O2 build option

1.2.91

New features

- Auto parameter complete support
- Add option -udev to help create udev rule to avoid use sudo
- Remove VT color at win7
- Fail back to verbose mode at win7
- Enable uboot shell mode
- Just print help when run uuu and doesn't scan auto.uuu in current directory.
- Added blog command to fetch message from uboot boot log
- Support file path include space. need add "" at file path
- Windows version built-in libusb
- New SDPV support to support -skipsql for uboot, which support auto scan uboot position.

Bug fixes

- Fixed uuu "fb[-t 1000]:" ucmd wait forever problem
 - Fixed missed sdpu: done at spl built in script
 - Fixed show nothing when wait for usb connection
 - Fixed random claim interface failure at windows platform
 - Fixed random crash when multi-device download at windows platform
 - Fixed memory leak.
 - Fixed #79 file all zero when ucp from target to host
 - Fixed crash when done is not last cmd
-

1.2.0

New features

- Support decompress bz2 file, `sdcard.bz2/*` means decompress it.
- Support enter shell after run script

Bug fixes

- Fix mx6 boot failure when enable security
- Fix windows version dependent on vs redistribute package

1.1.81

New features

- Support shell command
- Support shell command generate dynamic uuu command to burn sequence id, like MAC address
- Reduce cpu usage rate at windows platform by increase each bulk transfer size
- Added q(quit) to exit shell at -s mode

Bug fixes

- fixed some typo
- fixed build script qspi burn failure if file size > 1M
- fixed file locked by uuu to prevent user update it.
- fixed crash at special uboot size

1.1.41

New features

- Support SDP protocol (i.MX6x, i.MX7, i.MX8M, i.MX8MM)
- Support SDPS protocol (i.MX8QXP B0, i.MX8QM B0)
- Support SDPU protocol (uboot\SPL implemented SDP protocol)
- Support FB protocol (fastboot with uboot)
- Support FBK protocol (fastboot in kernel, daemon implement at imx-uuc)
- Support multi-device download
- Support built-in script

Bug fixes

- Fix sometime open usb device failure at windows platform.
 - Fix protocol case sensitive problem in script
 - Fix open zip file failure
-

Known issue

- Some old i.MX8MM board HID can't work in linux system. Need apply ROM patch to fix. Please contact FAE.
 - QXP/QM NAND image can't download by UUU because alignment requirement is difference
 - Bz2 file only support one that is generated by pbbz2. there are problem if use bzip2 generate bz2.
 - i.MX815 only support 3 boards at the same time.
 - Some typeC dell dock USB hub cause transfer timeout if meet some magic data pattern, see branch magic_pattern. Try use differece hub or direct connect to PC usb port if this happen.
-
